

Machine Learning I: Foundations

Exercise Sheet 0

Prof. Marius Kloft

TA: Billy Joe Franks

29.04.2020

Deadline: 28.04.2020

1. (MANDATORY) 5 Points

- Please organize yourself in groups of up to 3 people.
- You must hand in L^AT_EX compiled pdfs.
- Put the full names of all participants onto the solutions.
- Do not copy solutions from another group.
- You may work with people outside of your group, however in any case your group should write its own solutions.

2. (MANDATORY) 3+2 Points

- a) The projection of a vector \mathbf{x} onto another vector \mathbf{w} is defined as the orthogonal projection of \mathbf{x} onto a straight line parallel to \mathbf{w} . Assume $\mathbf{b} := \mathbf{x} - a_1 \frac{\mathbf{w}}{\|\mathbf{w}\|}$ and $\mathbf{b}^T \mathbf{w} = 0$ then $\Pi_{\mathbf{w}}(\mathbf{x}) := a_1$. Show that the projection of vector \mathbf{x} onto \mathbf{w} is equal to:

$$\Pi_{\mathbf{w}}(\mathbf{x}) := \frac{1}{\|\mathbf{w}\|} \mathbf{w}^T \mathbf{x}.$$

Let $\mathbf{a} := a_1 \frac{\mathbf{w}}{\|\mathbf{w}\|}$ be the vector parallel to \mathbf{w} with length $|\Pi_{\mathbf{w}}(\mathbf{x})|$ then \mathbf{b} is $\mathbf{b} := \mathbf{x} - \mathbf{a}$. By the definition above $\mathbf{b}^T \mathbf{w} = 0$. Now consider $\mathbf{w}^T \mathbf{x}$:

$$\mathbf{w}^T \mathbf{x} = \mathbf{w}^T \mathbf{a} + \mathbf{w}^T \mathbf{b} \quad (1)$$

$$= \mathbf{w}^T \mathbf{a} + 0 \quad (2)$$

$$= \frac{a_1}{\|\mathbf{w}\|} \mathbf{w}^T \mathbf{w} \quad (3)$$

$$= \frac{a_1}{\|\mathbf{w}\|} \|\mathbf{w}\|^2 \quad (4)$$

$$= a_1 \|\mathbf{w}\| \quad (5)$$

$$\frac{\mathbf{w}^T \mathbf{x}}{\|\mathbf{w}\|} = a_1 = \Pi_{\mathbf{w}}(\mathbf{x}) \quad (6)$$

(2) follows by $\mathbf{b}^T \mathbf{w} = 0$. (3) follows by $\mathbf{a} = a_1 \frac{\mathbf{w}}{\|\mathbf{w}\|}$.

- b) Let $f(\mathbf{x}) := \mathbf{w}^T \mathbf{x} + b$, with $\mathbf{w}, \mathbf{x} \in \mathbb{R}^d$, $b \in \mathbb{R}$. Let H be a hyperplane defined as $H := \{\mathbf{x} \in \mathbb{R}^d | f(\mathbf{x}) = 0\}$ and let $\tilde{\mathbf{x}} \in H$. The signed distance of $\mathbf{x} \in \mathbb{R}^d$ to H is $d(\mathbf{x}, H) := \Pi_{\mathbf{w}}(\mathbf{x} - \tilde{\mathbf{x}})$. Show that the signed distance can be equivalently defined as:

$$d(\mathbf{x}, H) := \frac{\mathbf{w}^T \mathbf{x} + b}{\|\mathbf{w}\|}.$$

Let $\tilde{\mathbf{x}} \in H$. Then

$$d(\mathbf{x}, H) = \Pi_{\mathbf{w}}(\mathbf{x} - \tilde{\mathbf{x}}) \quad (7)$$

$$= \frac{\mathbf{w}^T (\mathbf{x} - \tilde{\mathbf{x}})}{\|\mathbf{w}\|} \quad (8)$$

$$= \frac{\mathbf{w}^T \mathbf{x} - \mathbf{w}^T \tilde{\mathbf{x}}}{\|\mathbf{w}\|} \quad (9)$$

$$= \frac{\mathbf{w}^T \mathbf{x} + b}{\|\mathbf{w}\|} \quad (10)$$

(10) follows by $\tilde{\mathbf{x}} \in H$, $\mathbf{w}^T \tilde{\mathbf{x}} + b = 0$.

3. In this question we will have you do some exploration of the applications of machine learning. One of the goals of this lecture is for you to be able to identify learning problems on your own. To this end, describe three learning problems that have not been mentioned in the lecture. For each problem address the following:

- What is the data? (What are the inputs; what are the labels?)
- What is the goal? Are humans good at solving this task? Why, or why not?

- a1 Two-Player Games. The data is a set of current board positions, the label is which move should be taken.
- b1 The goal is to choose the best move among all available moves. In the past humans were much better at these tasks because labeling positions was generally difficult. Recently AI has beaten humans in the last remaining "difficult" game GO.
- a2 Image Segmentation. The data is a set of images, the label is a value for each pixel i.e. which object class does this pixel belong to. This task is effectively the next step from object detection.
- b2 The goal is to determine all objects and their locations within the image, this is important for a multitude of tasks, typically an image contains multiple classes. Humans are considered good at this task, however analysis shows AI can beat human accuracy.
- a3 Higher dimensional object recognition. The data is higher dimensional images or spatially related data as video. The labels are location and type of object.
- b3 As in the task of CT-scans, determining the location of for example cancerous tissue. Human doctors typically struggle with this task.

4. Make sure to set python notebook up on your computer, you can use the following link to do so <https://jupyter.readthedocs.io/en/latest/install.html>. Then solve programming task 0.
