

4.2 Kernel SVM

Machine Learning 1: Foundations

Marius Kloft (TUK)

Mernel Methods

2 Kernel SVM

Marius Kloft: 4.2 Kernel SVM 1/1

Recap

Kernel methods:

Use classifiers of the form

$$f(\mathbf{x}) = \operatorname{sign}(\langle \mathbf{w}, \boldsymbol{\phi}(\mathbf{x}) \rangle + b).$$

Kernel trick

- 1 Avoid computing $\phi(\mathbf{x})$ explicitly—instead formulate learning machine in a way that it accesses the data only through inner products $\langle \mathbf{x}_i, \mathbf{x}_j \rangle$
- **2** Replace all occurrences of $\langle \mathbf{x}_i, \mathbf{x}_j \rangle$ by $\mathbf{k}(\mathbf{x}_i, \mathbf{x}_j)$.

Next:

Example of kernel trick applied to SVM.

Example: SVM

Recall:

Unconstrained linear soft-margin SVM

$$\min_{b \in \mathbb{R}, \mathbf{w} \in \mathbb{R}^d} \frac{1}{2} \|\mathbf{w}\|^2 + C \sum_{i=1}^n \max \left(0, 1 - y_i(\mathbf{w}^\top \mathbf{x}_i + b)\right)$$

Proposition (representer theorem for SVM)

The optimal solution **w*** of the above SVM satisfies:

$$\exists \boldsymbol{\alpha} : \mathbf{w}^* = \sum_{i=1}^n \alpha_i \mathbf{x}_i,$$

where $X := (\mathbf{x}_1, ..., \mathbf{x}_n)$.

We omit the proof for now, but the theorem is very intuitive:

▶ It says that $\mathbf{w}^* \in \text{span}(\mathbf{x}_1, \dots, \mathbf{x}_n)$.

We now plug $\mathbf{w} = \sum_{i=1}^{n} \alpha_i \mathbf{x}_i$ into the SVM ...

Kernel SVM

...and obtain:

$$\min_{\boldsymbol{b} \in \mathbb{R}, \boldsymbol{\alpha} \in \mathbb{R}^n} \ \frac{1}{2} \sum_{i,j=1}^n \alpha_i \alpha_j \boxed{\mathbf{x}_i^\top \mathbf{x}_j} + C \sum_{i=1}^n \max \left(0, 1 - y_i \left(\sum_{j=1}^n \alpha_j \boxed{\mathbf{x}_i^\top \mathbf{x}_j} + b \right) \right).$$

We then replace all occurrences of $\mathbf{x}_i^{\mathsf{T}} \mathbf{x}_i$ by $k(\mathbf{x}_i, \mathbf{x}_i)$:

Kernel SVM

$$\min_{b \in \mathbb{R}, \alpha \in \mathbb{R}^n} \frac{1}{2} \sum_{i,j=1}^n \alpha_i \alpha_j k(\mathbf{x}_i, \mathbf{x}_j) + C \sum_{i=1}^n \max \left(0, 1 - y_i \left(\sum_{j=1}^n \alpha_j k(\mathbf{x}_i, \mathbf{x}_j) + b \right) \right)$$

We predict the label of a new point **x** using:

$$f(\mathbf{x}) = \operatorname{sign}\left(\mathbf{w}^{\top}\phi(\mathbf{x}) + b\right) = \operatorname{sign}\left(\sum_{i=1}^{n} \alpha_{i}k(\mathbf{x}_{i}, \mathbf{x}) + b\right).$$

How to solve the kernel SVM?

Kernel SVM Optimization

Could apply CVXOPT as Kernel SVM is convex (but too slow!)

Instead we apply a SGD sort of algorithm as follows:

Doubly SGD algorithm for kernel SVM

- 1: initialize (b, α) (e.g., randomly)
- 2: **for** t = 1 : T **do**
- 3: Randomly select B many data points
- Denote their indexes by $J \subset \{1, \dots, n\}$ (i.e., |J| = B)

5:
$$(b, \alpha) := (b, \alpha) - \lambda_t \nabla_{\alpha_J} \left(\frac{n^2}{2B^2} \sum_{i,j \in J} \alpha_i \alpha_j k(\mathbf{x}_i, \mathbf{x}_j) + \frac{Cn}{B} \sum_{i \in J} \max \left(0, 1 - y_i \left(\frac{n}{B} \sum_{j \in J} \alpha_j k(\mathbf{x}_i, \mathbf{x}_j) + b \right) \right) \right)$$

6: end for

FYI: an analogue derivation and algorithm can be stated for LR.

For instance, we can choose B = 100.

Can We Kernelize Also Other Linear Learning Machines?

Yes:

Theorem (general representer theorem)

Let $k : \mathbb{R}^d \times \mathbb{R}^d \to \mathbb{R}$ be a kernel over a Hilbert space \mathcal{H} . Let $L : \mathbb{R}^n \to \mathbb{R}$ be any function. Then any solution

$$\mathbf{w}^* \in \underset{\mathbf{w} \in \mathcal{H}}{\operatorname{arg \, min}} \ \frac{1}{2} \|\mathbf{w}\|^2 + L(\langle \mathbf{w}, \phi(\mathbf{x}_1) \rangle, \dots, \langle \mathbf{w}, \phi(\mathbf{x}_n) \rangle)$$

satisfies: there exist $\alpha_1, \ldots, \alpha_n$ such that $\mathbf{w}^* = \sum_{i=1}^n \alpha_i \phi(\mathbf{x}_i)$.

Marius Kloft: 4.2 Kernel SVM 6/13

The general representer theorem holds in particular also for the SVM. Thus the proof here serves also as a proof for the proposition shown on Slide 3.

Proof

Assume the contrary, that is, there exists an optimal solution

$$\mathbf{w}^* = \mathbf{w}_{\parallel} + \underbrace{\mathbf{w}_{\perp}}_{\neq 0}$$

with:

- ightharpoonup $\mathbf{w}_{\parallel} \in \operatorname{span}(\phi(x_1), \dots, \phi(x_n))$ and
- ▶ $\mathbf{w}_{\perp} \notin \text{span}(\phi(x_1), \dots, \phi(x_n))$, i.e., $\forall i : \langle \mathbf{w}_{\perp}, \phi(\mathbf{x}_i) \rangle = 0$.

Then, we have, for all i = 1, ..., n:

$$\langle \mathbf{w}^*, \phi(\mathbf{x}_i) \rangle = \langle \mathbf{w}_{||} + \mathbf{w}_{\perp}, \phi(\mathbf{x}_i) \rangle = \langle \mathbf{w}_{||}, \phi(\mathbf{x}_i) \rangle + \underbrace{\langle \mathbf{w}_{\perp}, \phi(\mathbf{x}_i) \rangle}_{=0}$$
$$= \langle \mathbf{w}_{||}, \phi(\mathbf{x}_i) \rangle.$$

Furthermore, we have:

$$\left\|\mathbf{w}^*\right\|^2 = \left\|\mathbf{w}_{||}\right\|^2 + \underbrace{\left\|\mathbf{w}_{\perp}\right\|^2}_{>0} > \left\|\mathbf{w}_{||}\right\|^2$$

Thus the objective function is smaller in the point \mathbf{w}_{\perp} than it is in the optimum \mathbf{w}^* . This contradicts the optimality of \mathbf{w}^* .

Conclusion

Kernel methods:

 Use linear classifiers on the data mapped into a high-dimensional space

Kernel trick:

- But never compute explicitely in that space
- requires formulating the learning machine in terms of inner products
 - which are then replaced by the kernel

Representer theorem:

this works for many linear learning machines

Example: SVM

Further Information (non-mandatory class content)

Marius Kloft: 4.2 Kernel SVM 10/13

For the Gaussian RBF kernel, we have a more efficient way of training kernel machines (such as the kernel SVM)...

It is based on the following Theorem:

Theorem (Bochner's Theorem)

The Gaussian RBF kernel k with bandwidth $\sigma^2 > 0$ satisfies the following identity:

$$k(\mathbf{x}, \tilde{\mathbf{x}}) = 2\mathbb{E}_{\substack{\mathbf{w} \sim N(0, I_d) \\ b \sim U(0, 2\pi)}} \left[\cos \left(\frac{\mathbf{w}^{\top} \mathbf{x}}{\sigma} + b \right) \cos \left(\frac{\mathbf{w}^{\top} \tilde{\mathbf{x}}}{\sigma} + b \right) \right]$$

Remark: we employ here the following notation.

- \triangleright $N(0, I_d)$ is the *d*-dimensional standard normal distribution.
- ▶ $U(0, 2\pi)$ is a uniform distribution on the interval $[0, 2\pi]$.

Random Features

Random features computation algorithm

- 1: **for** i = 1 : m **do**
- sample $\mathbf{w}_i \sim N(0, I_d)$
- sample $b_i \sim U(0,2\pi)$
- 4: end for
- 5: Define

$$\hat{\phi}_m : \mathbf{X} \quad \mapsto \quad \mathbb{R}^m \\ \mathbf{X} \quad \mapsto \quad \sqrt{\frac{2}{n}} \left(\cos \left(\frac{\mathbf{w}_1^\top \mathbf{x}}{\sigma} + b_1 \right), \dots, \cos \left(\frac{\mathbf{w}_m^\top \mathbf{x}}{\sigma} + b_m \right) \right)^\top$$

6: return $\hat{\phi}_m$

Corollary

Let $\hat{\phi}_m$ be the output of the above algorithm and k the Gaussian RBF kernel with bandwidth $\sigma^2 > 0$. Then:

$$orall \mathbf{x}, ilde{\mathbf{x}} \in \mathbb{R}^d: \ \left\langle \hat{\phi}_{m}(\mathbf{x}), \hat{\phi}_{m}(ilde{\mathbf{x}}
ight
angle \xrightarrow{m o \infty} k(\mathbf{x}, ilde{\mathbf{x}})$$

This results in a random-feature SVM training algorithm:

- ▶ Compute the map ϕ_m using the algorithm from the previous slide
- ▶ Apply the map to all training points, resulting in a dataset $\hat{\phi}_m(X) := \left\{ \hat{\phi}_m(\mathbf{x}_1), \dots, \hat{\phi}_m(\mathbf{x}_n) \right\}$
- ▶ Train a standard linear SVM solver on $\hat{\phi}_m(X)$ and \mathbf{y} (e.g., LINLINEAR or Vowpal Wabbit)

This means we can use a super-fast linear SVM solver to train a non-linear learning machine (Gaussian-RBF-kernel SVM)!

Works more generally for all linear learning machines that can be kernelized (e.g., logistic regression).
